SMILE SAVING SUGGESTIONS

LINCOLN PEDIATRIC DENTISTRY

Sugar: Having a diet high in sugar feeds the 400 types of bacteria in your mouth and can cause cavities, gingivitis, bad breath, and canker sores. It can also contribute to obesity. Remember to check the sugar content of your foods and beverages. Every 4 grams of sugar equals 1 teaspoon. Avoid a diet high in sugar.

Flossing/Brushing: Flossing daily cleans the mucous and food from areas that your toothbrush can't reach and helps prevent gingivitis, bad breath, and cavities. To prevent cavities and gingivitis/bleeding gums, brush your teeth and gums 2 times every day using a circular motion. Circles help clean underneath the gum tissue where bacteria hide.

Orthodontics: We refer patients as needed, usually after all permanent teeth have erupted around age 12-13. If you currently have braces, permanent white spots can appear on your teeth if they are not brushed and flossed properly. Your dentist/orthodontist may remove or not place braces until your brushing improves.

Human Papillomavirus (HPV): Talk to your pediatrician or family care practitioner about immunization against the Human Papillomavirus (HPV) which can cause oral cancer.

Tooth eruption: Most permanent teeth erupt by age 12. If a baby tooth is loose, wiggle it out to prevent discomfort and allow the permanent tooth to erupt in the correct location. Brush to prevent inflammation where teeth are erupting. Motrin or Tylenol may help relieve discomfort.

Sealants: Sealants are a protective coating placed on the chewing surfaces of the permanent molars to help prevent cavities. Avoid chewing ice and hard candy to prevent sealants from breaking.

Brushing: To prevent cavities and gingivitis/bleeding gums, brush your teeth and gums 2 times every day using a circular motion. Circles help clean underneath the gum tissue where bacteria hide.
